EMA — Final Scientific Advice

Date: 26 June 2019

Procedure: EMEA/H/SA/4021/1/2019/III

Product: BRX-101 (velantrine hydrochloride) film-coated tablets

Applicant: Borealis Therapeutics Europe B.V.

Question 3 (Quality)

Does the CHMP agree that bracketing of bottle counts (30-count and 500-count) is acceptable for the stability program supporting the marketing authorisation application?

CHMP answer

The bracketing approach is acceptable in principle, provided that the closure system, resin, and desiccant-to-tablet ratio are identical across all presentations, as stated in the briefing document. The applicant should demonstrate the equivalence of the moisture vapour transmission rate across presentations.

Question 4 (Quality)

Does the CHMP agree that 12 months of long-term stability data on three pilot-scale batches is sufficient at the time of submission, with a commitment to provide commercial-scale data post-approval?

CHMP answer

Yes. In line with the Guideline on Stability Testing of Existing Active Substances and Related Finished Products and ICH Q1A(R2), 12 months of data at the time of submission is acceptable. The applicant committed to place the first three production-scale batches on long-term stability and to report the data as a post-authorisation measure within 36 months of the marketing authorisation.
