FDA — Complete Response Letter

Date: 18 March 2025

NDA: 218944

Product: BRX-330 (salvenidol) inhalation powder, 100 mcg

Applicant: Borealis Therapeutics Inc.

We have completed our review of this application and have determined that we cannot approve it in its present form. We describe our reasons for this action below.

Product Quality

1. The delivered dose uniformity data across device life show 3 of 30 determinations outside 75–125% of label claim at end of device life for batch S30-R02. You must identify the root cause and propose a control strategy.

2. The proposed fine particle dose acceptance criterion of 30–50 mcg is wider than the range observed in the pivotal clinical batches (36–44 mcg). Tighten the criterion or provide clinical justification.

3. The lactose monohydrate particle size distribution specification should include a limit on the fine lactose fraction, given its demonstrated impact on fine particle dose.

Facility Inspection

A pre-approval inspection of the device assembly site is required before approval. The inspection could not be scheduled during this review cycle.

Resubmission

In the end-of-review meeting request you stated that you will resubmit with a revised delivered dose uniformity control strategy and the updated lactose specification by 31 December 2025. The resubmission will be managed by Priya Raman, Associate Director, Regulatory CMC.

Within one year after the date of this letter, you are required to resubmit or take other actions available under 21 CFR 314.110. If you do not take one of these actions, we may consider your lack of response a request to withdraw the application.

Sincerely,
Division of Pulmonology, Allergy, and Critical Care
Office of New Drugs, CDER
